

High Performance Logistics Model

Logistics Help develops high performance logistics operations for small to mid-sized organisations. Our logistics improvement model starts with redesigning your business process to better suit what you actually need and then builds the right infrastructure, systems and organisation to deliver efficiency reliability and accuracy. The end result is superior service to customers and lowest cost to the business.

- **Strategic alignment**
 - First we have a strategic conversation. What is your business? What do you want it to be? How do you intend to get there? What are your growth targets and likely growth rates? What is definitely in? What is ruled out? All of our work is bathed in your strategy and designed to help you build an organisation that can deliver it.
- **Business process optimisation**
 - We develop optimised processes customised to your business as the foundation of everything else that we do. Without the best possible process, you cannot build good systems or infrastructure and your staff may end up unproductive and frustrated.
- **Infrastructure design**
 - Warehouse layout for fast flow locks in high productivity by speeding all your warehouse activity.
 - Product slotting optimises where your stock is stored in the warehouse to minimise warehouse travel path.
 - High density storage matched to your product and order profile helps efficiency and maximises your return from your building investment.
 - Materials handling equipment matched to your storage systems delivers high productivity in put-away and picking operations.
- **Systems design**
 - We optimise your current business system to suit the re-engineered processes through better use of existing system functionality and light modifications that achieve significant results.
 - We have carefully chosen software partners that we work with to deliver affordable and customised solutions that support the revised business processes.
 - **Inventory planning system.** If you've been struggling with your accounting system's inadequate planning functionality, this system typically returns 30-50% of your current stock value back into your business for investment in business improvement or market expansion. This also frees up warehouse space improving efficiency and allowing for range expansion.
 - **Warehouse management system.** With 20-30% productivity improvements over paper based processes and 99.5%+ inventory accuracy from real time control of your warehouse via mobile devices and voice directed transactions, this system drives costs down and service performance up.
 - **Freight management system.** An integrated multi-carrier freight system records all your freight activity and is the foundation for improving warehouse despatch productivity and getting control of your freight costs.
 - **Other systems.** We apply the same methodology regardless of the system we implement. The best system for you may be the one you already have or a readily available extension. We are not locked in to working with the systems we specialise in. We can help you implement any system of your choosing to the same standard of efficiency.
- **Organisational development**
 - We help you communicate what is changing and why so you help your staff adapt quickly.
 - We help you develop the right organisational structure for the logistics operations of your business.
 - We develop procedures and work instructions documenting the new processes, systems and correct operation of the overall business system.
 - We train your staff and/or help you recruit the right staff for your business.
